

The Kings Club

Golf Course Clubhouse - Inverness, Scotland

The development of the new Kings Golf Club, which was completed in 2019, overlooks both the Caledonian Canal and the River Ness. Due to the scale and specific purpose of the building, a comprehensive plumbing and mechanical installation was essential for its functionality. Ri Cruden was contracted to manage this complex task, successfully handling the entire project from its initial stages through to completion.

The Works

- 2 Mitsubishi 14kW Ecodan air source heat pumps with associated buffer tank to supply hot water and space heating.
- Air source heat pump, in conjunction with a Joules underfloor heating system throughout the building.
- A 6kW 3 phase solar PV system, allowing The Kings Club to generate its own electricity.
- A new hot and cold water system, including all pipework and insulation.
- Sanitary appliances and drainage systems.
- New mechanical ventilation system, including extract fans, external grilles and ductwork.

Contractor: Compass Construction

Year: 2019
